

# Clinical Studies: Alkaline Water Improves Patients' Health

**Dr. H.Hayashi, M.D. and Dr. M.Kawamura, M.D. started using alkaline water in their clinic in 1985, and fifteen years on they presented the clinical improvements patients exhibited [1]:**

- › Reduction in blood sugar levels for diabetic patients.
- › Improvements in peripheral circulation in diabetic gangrene.
- › Reduction in uric acid concentration for gout patients.
- › Improved liver function for hepatic disorders.
- › Prevention and improvements in gastro duodenal ulcer recurrences.
- › Improvements in hypertension and hypotension patients.
- › Improvements in allergic disorders, such as asthma, urticarial, rhinitis and atopic dermatitis.
- › Improvements in persistent diarrhea after gastrectomy.
- › Faster postoperative recovery from bowel paralysis.
- › Improvements in serum bilirubin levels in newly born babies.
- › Noticeable changes in both color and odor of feces.
- › Reduction in number of patients complaining of constipation.

These clinical findings lead to the conclusion that drinking alkaline water likely decreases the production of harmful products left from the digestion process. It was their recommendation that alkaline water from an electric water ionizer should be seriously considered for both cooking meals and drinking for patients.
